

# MACHINE LEARNING QUICK REFERENCE: ALGORITHMS - 1

Algorithm Type	Common Usage	Suggested Usage	Suggested Scale	Interpretability	Common Concerns
<b>Penalized Regression</b>	<ul style="list-style-type: none"> <li>Supervised regression</li> <li>Supervised classification</li> </ul>	<ul style="list-style-type: none"> <li>Modeling linear or linearly separable phenomena</li> <li>Manually specifying nonlinear and explicit interaction terms</li> <li>Well suited for <math>N \ll p</math></li> </ul>	Small to large data sets	High	<ul style="list-style-type: none"> <li>Missing values</li> <li>Outliers</li> <li>Standardization</li> <li>Parameter tuning</li> </ul>
<b>Naïve Bayes</b>	Supervised classification	<ul style="list-style-type: none"> <li>Modeling linearly separable phenomena in large data sets</li> <li>Well-suited for extremely large data sets where complex methods are intractable</li> </ul>	Small to extremely large data sets	Moderate	<ul style="list-style-type: none"> <li>Strong linear independence assumption</li> <li>Infrequent categorical levels</li> </ul>
<b>Decision Trees</b>	<ul style="list-style-type: none"> <li>Supervised regression</li> <li>Supervised classification</li> </ul>	<ul style="list-style-type: none"> <li>Modeling nonlinear and nonlinearly separable phenomena in large, dirty data</li> <li>Interactions considered automatically, but implicitly</li> <li>Missing values and outliers in input variables handled automatically in many implementations</li> <li>Decision tree ensembles (e.g., random forests and gradient boosting) can increase prediction accuracy and decrease overfitting, but also decrease scalability and interpretability</li> </ul>	Medium to large data sets	Moderate	<ul style="list-style-type: none"> <li>Instability with small training data sets</li> <li>Gradient boosting can be unstable with noise or outliers</li> <li>Overfitting</li> <li>Parameter tuning</li> </ul>
<b>k-Nearest Neighbors (kNN)</b>	<ul style="list-style-type: none"> <li>Supervised regression</li> <li>Supervised classification</li> </ul>	<ul style="list-style-type: none"> <li>Modeling nonlinearly separable phenomena</li> <li>Can be used to match the accuracy of more sophisticated techniques, but with fewer tuning parameters</li> </ul>	Small to medium data sets	Low	<ul style="list-style-type: none"> <li>Missing values</li> <li>Overfitting</li> <li>Outliers</li> <li>Standardization</li> <li>Curse of dimensionality</li> </ul>
<b>Support Vector Machines (SVM)</b>	<ul style="list-style-type: none"> <li>Supervised regression</li> <li>Supervised classification</li> <li>Anomaly detection</li> </ul>	<ul style="list-style-type: none"> <li>Modeling linear or linearly separable phenomena by using linear kernels</li> <li>Modeling nonlinear or nonlinearly separable phenomena by using nonlinear kernels</li> <li>Anomaly detection with one-class SVM (OSVM)</li> </ul>	<ul style="list-style-type: none"> <li>Small to large data sets for linear kernels</li> <li>Small to medium data sets for nonlinear kernels</li> </ul>	Low	<ul style="list-style-type: none"> <li>Missing values</li> <li>Overfitting</li> <li>Outliers</li> <li>Standardization</li> <li>Parameter tuning</li> <li>Accuracy versus deep neural networks depends on choice of nonlinear kernel; Gaussian and polynomial often less accurate</li> </ul>
<b>Artificial Neural Networks (ANN)</b>	<ul style="list-style-type: none"> <li>Supervised regression</li> <li>Supervised classification</li> <li>Unsupervised clustering</li> <li>Unsupervised feature extraction</li> <li>Anomaly detection</li> </ul>	<ul style="list-style-type: none"> <li>Modeling nonlinear and nonlinearly separable phenomena</li> <li>Deep neural networks (e.g., deep learning) are well-suited for state-of-the-art pattern recognition in images, videos, and sound</li> <li>All interactions considered in fully connected, multilayer topologies</li> <li>Nonlinear feature extraction with autoencoder and restricted Boltzmann machine (RBM) networks</li> <li>Anomaly detection with autoencoder networks</li> <li>Clustering and visualization with self-organizing maps (SOMs)</li> </ul>	<ul style="list-style-type: none"> <li>Usually small to medium data sets</li> <li>Stochastic gradient descent (SGD) optimization drastically increases scalability</li> </ul>	Low	<ul style="list-style-type: none"> <li>Missing values</li> <li>Overfitting</li> <li>Outliers</li> <li>Standardization</li> <li>Parameter tuning</li> </ul>

## MACHINE LEARNING QUICK REFERENCE: ALGORITHMS - 2

Algorithm Type	Common Usage	Suggested Usage	Suggested Scale	Interpretability	Common Concerns
<b>Association Rules</b>	<ul style="list-style-type: none"> <li>Supervised rule building</li> <li>Unsupervised rule building</li> </ul>	Building sets of complex rules by using the co-occurrence of items or events in transactional data sets	Medium to large transactional data sets	Moderate	<ul style="list-style-type: none"> <li>Instability with small training data</li> <li>Overfitting</li> <li>Parameter tuning</li> </ul>
<b>k-Means</b>	Unsupervised clustering	<ul style="list-style-type: none"> <li>Creating a known a priori number of spherical, disjoint, equally sized clusters</li> <li>k-modes method can be used for categorical data</li> <li>k-prototypes method can be used for mixed data</li> </ul>	Small to large data sets	Moderate	<ul style="list-style-type: none"> <li>Missing values</li> <li>Outliers</li> <li>Standardization</li> <li>Correct number of clusters is often unknown</li> <li>Highly sensitive to initialization</li> <li>Curse of dimensionality</li> </ul>
<b>Hierarchical Clustering</b>	Unsupervised clustering	Creating a known a priori number of nonspherical, disjoint, or overlapping clusters of different sizes	Small data sets	Moderate	<ul style="list-style-type: none"> <li>Missing values</li> <li>Standardization</li> <li>Correct number of clusters is often unknown</li> <li>Curse of dimensionality</li> </ul>
<b>Spectral Clustering</b>	Unsupervised clustering	Creating a data-dependent number of arbitrarily shaped, disjoint, or overlapping clusters of different sizes	Small data sets	Moderate	<ul style="list-style-type: none"> <li>Missing values</li> <li>Standardization</li> <li>Parameter tuning</li> <li>Curse of dimensionality</li> </ul>
<b>Principal Components Analysis (PCA)</b>	Unsupervised feature extraction	<ul style="list-style-type: none"> <li>Extracting a data-dependent number of linear, orthogonal features, where <math>N \gg p</math></li> <li>Extracted features can be rotated to increase interpretability, but orthogonality is usually lost</li> <li>Singular value decomposition (SVD) is often used instead of PCA on wide or sparse data</li> <li>Sparse PCA can be used to create more interpretable features, but orthogonality is lost</li> <li>Kernel PCA can be used to extract nonlinear features</li> </ul>	<ul style="list-style-type: none"> <li>Small to large data sets for traditional PCA and SVD</li> <li>Small to medium data sets for sparse PCA and kernel PCA</li> </ul>	Generally low, but higher for sparse PCA or rotated solutions	<ul style="list-style-type: none"> <li>Missing values</li> <li>Outliers</li> </ul>
<b>Nonnegative Matrix Factorization (NMF)</b>	Unsupervised feature extraction	Extracting a known a priori number of interpretable, linear, oblique, nonnegative features	Small to large data sets	High	<ul style="list-style-type: none"> <li>Missing values</li> <li>Outliers</li> <li>Standardization</li> <li>Correct number of features is often unknown</li> <li>Presence of negative values</li> </ul>
<b>Random Projections</b>	Unsupervised feature extraction	Extracting a data-dependent number of linear, uninterpretable, randomly-oriented features of equal importance	Medium to extremely large data sets	Low	Missing values
<b>Factorization Machines</b>	<ul style="list-style-type: none"> <li>Supervised regression and classification</li> <li>Unsupervised feature extraction</li> </ul>	<ul style="list-style-type: none"> <li>Extracting a known a priori number of uninterpretable, oblique features from sparse or transactional data sets</li> <li>Can automatically account for variable interactions</li> <li>Creating models from a large number of sparse features; can outperform SVM for sparse data</li> </ul>	Medium to extremely large sparse or transactional data sets	Moderate	<ul style="list-style-type: none"> <li>Missing values</li> <li>Outliers</li> <li>Standardization</li> <li>Correct number of features is often unknown</li> <li>Less well suited for dense data</li> </ul>
